

Continuous Assessment Test – I - JAN 2025

Programme	: B.Tech (CSE)	Semester	: WS 2024-2025
Course Code & Course Title	BCSE305L & Embedded Systems	Class Number	CH2024250501594 CH2024250501599 CH2024250501619 CH2024250501627 CH2024250501632 CH2024250501596
Faculty	VIJAYKUMAR P NITISH KATAL SINDHUJA M KIRAN KUMAR M SUHASINI SHARON GIFTSY A L	Slot	: E1+TE1
Duration	: 90 minutes	Max. Mark	50

General Instructions:

- Write only your registration number on the question paper in the box provided and do not write other information.
- Use statistical tables supplied from the exam cell as necessary
- Use graph sheets supplied from the exam cell as necessary
- Only non-programmable calculator without storage is permitted

Answer all questions

Q. No	Sub Sec.	Description	Marks	Blooms Taxonomy Level
1.		<p>Explain the different phases involved in the embedded system design process for designing a digital pulse oximeter to measure oxygen saturation level for the covid patients. Apply top-down approach.</p>  <ol style="list-style-type: none"> A 32-bit ARM Cortex-M4 core, which supports digital signal processing (<u>DSP</u>) for filtering signals. Measure oxygen saturation (<u>SpO2</u>) by observing pulse rate (heartbeats per minute) and display these values on a digital interface. Provide real-time feedback and alert system. Photodiode, one red and infra-red LEDs are used as sensors in oximeter are powered by Li-ion/LiPo battery with charging circuitry. Continuously update the display with calculated <u>SpO2</u> and pulse rate in OLED. If needed, implement warning messages for abnormal readings (e.g., <u>SpO2</u> < 90%). 	10	K2

2.		With a neat sketch of the functional block diagram/architecture, describe the salient features available in the 8-bit microcontroller based on Harvard architecture.	10	K1
3.	a	<p>Write an Arduino Program to develop a water level indicator installed in the water tank for greenhouse farming with an <u>ADC</u> interface involving detecting the level of water in the water tank. Alert the user or taking automated actions (like triggering a light or alarm). Draw the connection diagram and write a program to implement this system. [3+7 marks]</p> <p>i) If water level threshold is 200 – Display a message “Water level is low” in <u>serial</u> monitor and turn ON, the <u>buzzer</u> and <u>LED</u> should be High.</p> <p>ii) If water level threshold is 800 – Display a message “Water level is High” in serial monitor and turn OFF, the buzzer and LED should be High.</p> <p>iii) If water level is within the normal range (between 200-800) – Display a message “Water level is Normal” in serial monitor and turn OFF, the buzzer and LED should be Low.</p>	10	K3
	b	List the unique characteristics for asynchronous transmission and reception of data through a serial communication using memory I/O interfacing.	5	K1
4.		<p>Write an Arduino code for automatic toll collection system. Vehicles passing through a toll booth are detected using an <u>IR sensor</u>. The system employs a <u>timer/counter</u> for the following operations:</p> <ul style="list-style-type: none"> Vehicle Detection and Toll Charging: When a vehicle passes the <u>IR sensor</u>, a timer starts to count the duration the vehicle takes to cross the booth. If the vehicle takes less than 10 seconds to cross, it is classified as a "Fast Vehicle" and a standard toll fee is applied. If the vehicle takes more than 10 seconds, it is classified as a "Slow Vehicle," and an additional surcharge is added to the toll fee. Vehicle Flow Rate Monitoring: The <u>counter</u> keeps track of how many vehicles have passed through the toll booth in the past minute. Overstay Detection: If a vehicle remains in the IR sensor's range for longer than 30 seconds, an alert is raised via a <u>buzzer</u>. Then the buzzer will be OFF after 5 seconds. <p>Draw the connection diagram and write a program to implement this system. [3+12 marks]</p>	15	K3
